

First 90 Days: Earn Technical Trust Through Bounded Delivery

Entry principle: do not ask for broad authority before earning local technical trust. Learn the house style, own a bounded workstream, and turn validated delivery learning into leverage.

Days 0-30 · Learn the house style

Work	Purpose	Exit evidence
Map architecture, delivery, quality, security, review, and MILO contribution paths.	Understand how 3Cloud actually makes decisions before proposing a new mechanism.	Reviewed operating map and stakeholder topology.
Pair on active design reviews and delivery ceremonies.	Learn technical norms, vocabulary, and escalation thresholds.	One accepted contribution to an active engagement.
Close Azure-specific gaps against the real stack.	Target the documented candidacy risk rather than pursue a generic checklist.	Explicit learning plan with senior technical validation.
Create one seam-risk map.	Expose integration assumptions without adding ceremony.	Risk map used in one delivery conversation.

Days 31-60 · Own a bounded workstream

Work	Purpose	Exit evidence
Translate architecture into tasks, interfaces, and acceptance criteria.	Protect intent through delivery decomposition.	Accepted increment and traceable decisions.
Stand up evaluation and telemetry early.	Make release evidence part of delivery, not a late gate.	Golden/adversarial cases and observable outcome signals.
Coordinate one cross-practice interface.	Clarify ownership, dependencies, and escalation paths.	Reduced integration ambiguity and visible risk posture.
Mentor through pairing and review.	Strengthen capability while preserving delivery accountability.	Peer feedback and reusable review notes.

Days 61-90: Harvest the Pattern

Work	Purpose	Exit evidence
Run a closeout separating client context from reusable mechanisms.	Avoid both reinvention and careless copying.	Adaptation boundary and dependency record.
Package one proven candidate asset for MILO/IP review.	Turn delivery learning into governed leverage.	Asset with owner, version, failure modes, and real-use evidence.
Share a focused learning session.	Return practical knowledge to the relevant community of practice.	Feedback and next-use candidates.
Propose the next 90-day technical-depth plan.	Use observed gaps, not assumptions, to set the next scope.	Agreement on learning priorities and ownership path.

Operating cadence

Cadence	Question	Artifact
Weekly	What decision or handoff could become rework?	Seam-risk note and owner.
Biweekly	Does evaluation still reflect the real workflow?	Updated cases and failure taxonomy.
Monthly	Where is delivery learning becoming reusable?	Harvest candidate review.
Day 30 / 60 / 90	What scope has been earned and what gap remains?	Evidence-based entry review.

Success measures

- **Delivery:** accepted increments, predictable handoffs, reduced integration rework.
- **Quality:** explicit release evidence, escaped-defect signals, known failure modes.
- **Trust:** clear authority boundaries, escalation ownership, reviewer agreement.
- **Adoption:** actual workflow use, overrides, abandonment, and user feedback.
- **Reuse:** qualified asset candidate with adaptation burden understood.
- **Learning:** Azure-specific gap closure demonstrated through work.

90-day promise: enter with humility about platform-specific gaps, make the quality of decisions and handoffs visible, and earn broader scope through evidence.
